

Gaussian Bandit: Standard vs. Practitioner Regret (Static) (Thompson Sampling & Gaussian UCB)

Standard Pseudo-Regret

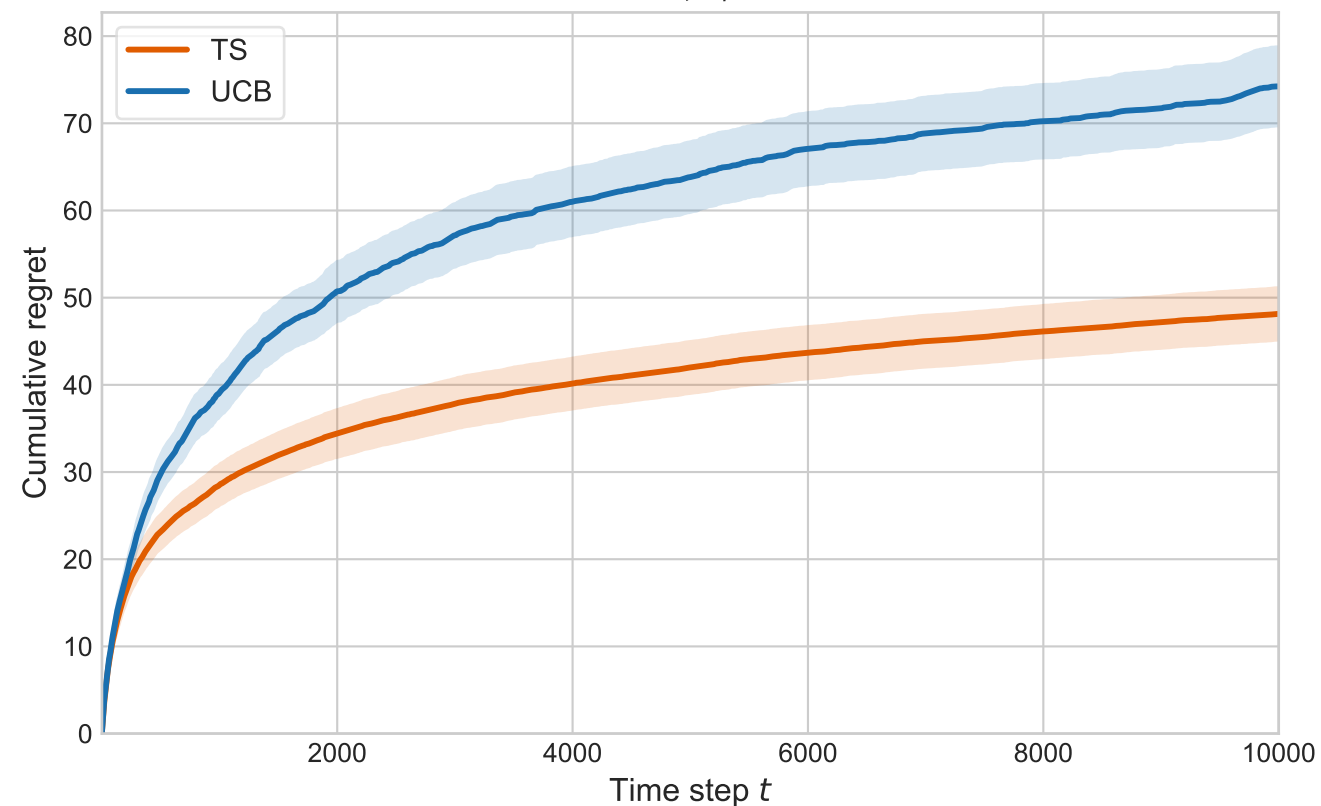

$$R(T) = \sum_{t=1}^T \Delta_{a_t}$$

Practitioner (ε^* -) Regret

$$R^\dagger(T) = \sum_{t=1}^T \max(\Delta_{a_t} - \varepsilon^*, 0)$$

$$\varepsilon^* = 0.0500, c_T = 0.0607$$

Arm means: [0.8 0.75 0.5 0.2 -0.2]
Gaps: [0. 0.05 0.3 0.6 1.]
sigma=1.0, eta=0.5, T=10000, N=100
c_T=0.0607, epsilon*=0.0500
